Acceptance Criteria Workshop

Responsive layout

When the site is viewed on a mobile device 320 - 767px wide, the navigation, content section, images, and buttons must fit within the viewport without horizontal scrolling so that users can easily browse the garden information on a phone. I will rest this by resizing the browser and checking the sites at 320px, 375px, and 767px widths.

Responsive layout

When the site is viewed on a tablet or desktop screen at 768px wide or large, the garden information and event sections must rearrange into a multi column layout while maintaining readable spacing and hierarchy so that users can quickly find information on larger screens. I will test this by viewing the site at 768px, 1024px, and 1440px widths.

Accessibility

When a user navigates the website without a mouse, all navigation links, buttons, forms, and interactive elements must be available and usable with the keyboard so that users can access the garden groups information without relying on a mouse. I will test this by using only the Tab, Shift + Tab, Enter, and Space keys to see if the navigation works on all parts of the site.

Accessibility

When images of the community garden, events, or volunteers are being shown, each image must include descriptive alt text so that users that are using screen readers can understand the purpose or content of the image. I will test this by inspecting the HTML for alt attributes and using screen reader to verify that the descriptions are working.

Browser support

When the website is opened in current versions of Chrome, Firefox, Safari, or Edge, the main navigation, pages, forms, images, and responsive layouts must be functional, with a fallback styling or content used when an extra CSS or browser feature is unsupported so that users can still access the sites core information. I will test this by opening the site in each target browser and checking the main pages and interactive features.

Performance

When a user opens any primary page, the page must load its essential content without loading the large images or files so that users can quickly access information about the community garden. I will test this by running the pages through Google Lighthouse and checking how well those pages run.

Metadata/discoverability

When a search engine is listing each primary page, the page must include a unique descriptive title, meta description, and relevant heading structure that identifies the community garden group and the page's purpose so that users can understand the page from search results. I will test this by inspecting the page source and checking each page with a metadata or SEO auditing tool.

Release-quality

When the website is prepared for its final release, all navigation links, event information, forms, images, and buttons must function as intended without showing any errors so that users can successfully find information and contact. I will test this by completing a final manual walkthrough of every page and checking all links, forms, images, and interactive elements.
